                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Rypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically shear
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects.
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (

4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome sbotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

The present sequence is that of a 3' PCR primer, used with the 5' primer CC given in AAF30355, to amplify a cDNA fragment corresponding to mucleotides 352-1055 of the human mitotic checkpoint protein Chfr (see Cfir gene encodes the human mitotic checkpoint protein Chfr (see CC AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DID1, HT29, HCT116, SAOS2, UZOS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and chfr mucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more sensitive to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chance, are useful for treatment of a partient having a condition CC associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to carymatic most of CLCA1 and mutations within diseased cells or to detect the presence of CLCA1 and mutations within diseased represents an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic obstructive pulmonary disease (COPD).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstruct pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                    antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinet acetylcysteine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Thompson J, Grupe A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CDPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition comparises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corricosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The cucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The mucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) ger by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstruction pulmonary disease (COPD), chronic bronchitis and asthma.
   New isolated nucleic with tumors and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thompson J, Grupe A;

               The invention relates to a 450 kD human epidermal autoantigen, epiplakin (ADC59448), and nculeic acids encoding it (ADC59447). The invention also encompasses an epiplakin antigenic epitope (ADC59449) which is reactive with serum from patients with autoimmune disease, fusion polypeptides containing epiplakin or its epitope, an antibody against epiplakin, host cells compresing human epiplakin nucleic acids transgenic animals which under- or over-express epiplakin, epiplakin nucleic acid probes for diagnosis of autoimune disease, and methods of screening for agents which modulate epiplakin activity. Epiplakin polypeptides and polymucleotides are useful in drug screening for agents which promote or inhibit the activity of epiplakin which can be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (ant.) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                       Novel protein having epiplakin activity, useful for screening as which inhibit and activate epiplakin activity, and for treating autoimmune skin disease such as pemphigoid or pemphigus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; epiplakin; epidermal autoantigen; autoimmune disease; skin disease; transgenic animals; diagnosis; drug screening; pemphigoid; pemphigoid; pemphigus; dermatological; immunosuppressive; expression analysis; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pemphigus; dermatological; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                 This oligonucleotide primer was designed to amplify a conserved region of the pleckstrin homology domain of clone 145/H. It was used with a reverse primer (see AAV6425) in the PCR amplification of the CDNA derived from mouse embryo (11 day post-coitus) liver. A PCR product, termed CH7, was subsequently used as probe to screen the embryonic liver library. 2 Overlapping clones were obtained and used to produce a nucleotide sequence (see AAV6414) coding for a novel protein, termed praja-1 (see AAW81641), of the mouse early developing liver. These can be used in the treatment and diagnosis of liver disease and other disorders, including those relating to oncogenesis and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pemphigus: Epiplakin antibodies and nucleic acid probes are useful diagnosis of these diseases. Sequences ADC59459-ADC59460 represent epiplakin PCR primers used to generate a probe used in expression analysis in an example of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                       isolated during early liver development that are useful in the diagnosis CC and treatment of end stage liver disease and other disorders. Specifically, it refers to genes that encode proteins such as elf 1-3, CC livor-1 (145), pk, protein 106 and praja-1. The present invention CC describes the characterisation of these early liver development proteins, cc and also methods to raise peptide specific antibodies that are useful as markers, as well as for tracing hepatocyte lineage. Furthermore, elf CC proteins 1-3 are useful in treating disorders including cholestasis, cc biliary stones, hepatic obstruction, stricture, primary biliary cirrhosis cr primary sclerosing cholangitis. In addition, through using gene cetoderm dysplasia, hepatocellular carcinoma and other diseases including anaemia, ataxia, degenerative neurological disorders and hemochromatosis. Accordingly, these proteins can be described as chepatotropic, cytostatic, neuroprotective, antianaemic and cardiant. This cligonucleotide sequence is the forward PCR primer used to amplify murine colone 145/PH of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                          polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of a lost 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 13 primer pairs are shown in AAQ95915-46. The published size range of the D16S413 allele is 13-149 bp, and the degree of heterozygosity in the population is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chance, are useful for treatment of a patient having a condition cassociated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the creatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to cate presence of CLCA1 and mutations within diseased cells or to detect the presence of CLCA1 and mutations acid. The invention represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, A-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ5989 - ABZ65216, ABZ64544 - ABZ65531. ABZ66520 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-MAY-2001; 2001US-0294140P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour suppressor gene 16; TSG16; immune response modulator; inflammatory response modulator; signal transduction activator; cytokine inhibitor; gene therapy; anticancer; anti-inflammatory; autoimmune disorder; infection; chromosome 16q24.3; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human tumour suppressor gene 16 (TSG16; see AH23688). TSG16 was isolated from chromosome 16q24.3. TSG16 suppresses cellular proliferation. TSG16 is useful for treating disorders associated with decreased expression or activity of TSG16, e.g. cancers, (auto)immune disorders, inflammation, complications of wound healing and infortions of the relations of the suppression of the s
The present invention relates to human tumour suppressor gene 16 (TSG16; BAH2368). TSG16 was isolated mid from chromosome 16q24.3. TSG16 suppresses cellular proliferation. TSG16 is useful for treating disorder; suppresses cellular proliferation or activity of TSG16, e.g. cancers, associated with decreased expression or activity of TSG16, e.g. cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAH27375 standard; DNA;

                                                                                                                         The present invention relates to human tumour suppressor gene 16 (TSG16; see AH23688). TSG16 was isolated from chromosome 16q24.3. TSG16 suppresses cellular proliferation. TSG16 is useful for treating disorders associated with decreased expression or activity of TSG16, e.g. cancers, (auto)immune disorders, inflammation, complications of wound healing and infections (by viruses, bacteria, fungi, parasites, protozoa or helminths). The present sequence is a PCR primer, which was used in the

                     CC downregulate expression of one or more human epidermal growth factor CC receptor (EGFR) genes (including HER1, HER2 and HER4) by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may CC be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and CC an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are CC used to modulate expression of EGFR genes in cells, tissue explants or CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants (for the treatment of a variety of conditions. They may be used for CC treating a wide range of cancers such as breast and ovarian cancer. The SiNAs are also useful for drug screening, diagnosis, therapeutic target CC identification and validation, genetic engineering, pharmacogenomics, Studying gene function, and gene mapping (e.g., of single nucleotide).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-JUN-2002;

The invention relates to short interfering nucleic actus vertically downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short an antisense oligonucleotide. Specifically, the siNAs include short of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             airpin RNA (shRNA). The siNAs can be unmodified or Green Cally Synthesised, can contain deoxyribonucleotides, and can be chemically Synthesised, cxpressed from a vector or enzymatically Synthesised. The invention also CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates cand/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of EGFR genes in cells, tissue explants or corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants corect the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The custing a wide range of cancers such as breast and ovarian cancer. The cidentification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide copolymorphisms). The present sequence represents the lower strand of a HER2 (EGFR2)-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

HDPACKI is identical to HIV with 3 important deletions which eliminate an essential packaging signal, part of the env region and the nef and 3' LTR region which is replaced by the polyA site of the SV40 late genes. This construct when coexpressed with the defective RNAs provide proteins for the assembly of new defective virus particles. Example VIII describes the construction of the packaging provirus DNA construct HDPACKI which requires a number of deletions and the addition of a polyA site. The primers of AAQ33459-66 were used. Primers PACK Primer #1 and #2 were used in PCR with pNI4-3 as template. Primer #1 is a deletion primer which removes part of the essential packaging signal. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.
                                                                                                                                                                                                                                                                                                                                                                                                                   Example VIII;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to coding sequences for proteins such as aromatic dihydrodiol dehydrogenase, aromatic diol oxygenase, hydratase-aldorase and aldehyde-dehydrogenase (ABA01198-ABA01201 and AAM52344-AAM52347), which are involved in the degradation of polycyclic aromatic compounds. The enzymes are useful as reagents for converting the metabolite intermediates of polycyclic aromatic compounds such as phenanthrene and anthracene. The present sequence is a PCR primer, which was used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for diagnosing a pre-disposition drug induced livertoxicity which involves determining at least one nucleotide polymorphism (SNP) in the UDP-glucuronosyl transferase gene. The method is useful for detecting a predisposition to a hepatotoxic reaction of a human being caused by administration of a pharmaceutically active compound based on determination of a SNP in gene in a sample of the human being. Nucleic acids containing polymorphism are useful for performing sequence identification. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               also useful in screening assays, to establish animal, cell and models for drug metabolism and for genotyping individuals. The sequence is a common PCR primer used to detect human UGT1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting predisposition to hepatotoxic reaction of human being caused administration of a compound, by determining single nucleotide polymorphism in UDP-glucuronosyl transferase gene in sample of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-JUL-2000; 2000EP-00115353

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polynucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABU65041-ABU65218
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-MAR-2001;

                                    This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460.ABX13462 and ABX97185. ABX97593 represent PCR primers polynucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABU65041-ABU65218
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Padigaru

                                                                                                                                      맑
                                                                                                                                                                     S
                                                                                                                                                                                                                                                                        # K K K H
                                                                                                                                                                                                                                                                                                This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cyrostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method is useful for prediction, diagnosis or prognosis of malignant neoplasia such as breast cancer, ovarian cancer, gastric cancer, colon cancer, cesophageal cancer, mesenchymal cancer, bladder cancer or non-small cell lung cancer. The polymucleotides and polypeptides defined in the specification, antisense polymucleotides targeting the polymucleotides, and compounds identified by the screening methods are useful for preventing or treating malignant neoplasia. The disease treated is preferably breast cancer. The present sequence is that of a PCR primer which was used in the exemplification of the invention.

The invention relates to an isolated polypeptide (designated NOVX, or CO NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also included are an isolated nucleic acid molecule encoding NOVX, a vector comprising the nucleic acid, a cell comprising the vector, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of or predisposition to a disease associated with altered levels of expression concept the above polypeptide or nucleic acid molecule in a first mammalian consultation to a method for identifying an agent that binds to the above polypeptide, a method for identifying a potential therapeutic agent for construction or physiological interactions of the polypeptide, a method of capathology that is related to aberrant conscious in the treatment of a pathology that is related to aberrant set of a pathology associated with the polypeptide, a method of cativity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating the activity of the polypeptide cited above. The composition and methods conscious as a set of the activity of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. The composition and methods conscious as a section of the polypeptide cited above. Th

These may also be used i chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The polypeptides are also useful as vaccines. The present sequence is an RTQ-PCR (real time quantitative PCR) primer uto assay tissue specific expression of a NOVX mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide (designated NOVX, or CC NOV1-NOV127) comprising a sequence selected from 178 fully defined amino CC acid sequences (and their mature forms, variants and fragments). Also CC included are an isolated nucleic acid molecule encoding NOVX, a vector CC comprising the presence or amount of the polypeptide or the nucleic acid molecule encoding NOVX, a vector CC predisposition to a disease associated with altered levels of expression CC included are amethod for identifying an agent that binds to the above polypeptide or nucleic acid molecule in a first mammalian CC subject, a method for identifying a potential therapeutic agent for CC expression or physiological interactions of the polypeptide, a method of agent pathology that is related to aberrant CC expression or physiological interactions of the polypeptide, a method of cc a pathology associated with the polypeptide and a method for modulating CC an pathology associated with the polypeptide and a method for modulating CC are useful for diagnosing, preventing or treating diseases such as CC diabetes, obseity, infectious diseases, anorexia, cancer-associated CC carexia, cancer, neurodegenerative disorders like Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders. The Composition and other chronic diseases. These may also be used in CC chromosome mapping, tissue typing, preventive medicine and CC pharmacogenomics. The polypeptides are also useful as vaccines. The CC present sequence is an RTQ-PCR (real time quantitative PCR) primer used CC to assay tissue specific expression of a NOVX mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XFFX&XSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of PCR primer DiSerB for the csrC gene CC ADQ76906 of Escherichia coli strain K-12. DiSerB was used with primer CC DiChecki ADQ76916 in an example from the invention for the construction of a csrC null mutant. CsrC interacts with the RNA-binding protein CsrA, CC and antagonises the regulatory effects of CsrA. The invention relates to the csrC gene and RNA, and methods of using these to modulate biofilm CC formation. A claimed method of altering the metabolism or structural or CC functional properties of a bacterial cell comprises altering the genetic CC expression of csrC or the CsrA binding activity of csrC. A result of CC altered genetic expression of csrC may be a change in glycogen CC biosynthesis or gluconeogenesis. A claimed method of reducing biofilm CC cell. A claimed method of inhibiting motility of biofilm-producing CC cell. A claimed method of inhibiting motility of biofilm-producing CC reducing the symptoms of a bacterial infection by biofilm-producing CC bacteria comprises increasing csrC expression. A claimed method of creducing the symptoms of a bacterial infection by biofilm-producing CC bacteria in a mammalian patient involves administering an antibacterial CC agent and decreasing biofilm formation through modulation of csrC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

            an insecticidal protein by delivering an insecticidal protein or protein domain to the gut epithelium of a target insect using a targeting protein capable of binding to the gut epithelium. Insecticidal and targeting protein protein do not both originate from Bacillus thuringiensis (B.t.). The hybrid proteins are used as insecticides. The hybrid proteins have increased toxicity against target pests. The present sequence represents an adapter sequence which is used in the construction of hybrid toxins in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method has been developed of increasing the host range or toxicity of an insecticidal protein by delivering an insecticidal protein or protein domain to the gut epithelium of a target insect using a targeting protein capable of binding to the gut epithelium. Insecticidal and targeting protein do not both originate from Bacillus thuringiensis (B.t.). The hybrid proteins are used as insecticides. The hybrid proteins have increased toxicity against target pests. The present sequence represents an adapter sequence which is used in the construction of hybrid toxins in an example from the present invention

The invention relates to a hybrid pesticidal protein toxin comprising a cytotoxic agent and a pest gut epithelial cell recognition portion of a protein, where the cytotoxic agent and the recognition portion are not naturally contiguous. The hybrid toxin is expressed by the gene fragment from B.thuringiensis (B.t) var. kurstaki HD-73 which is transformed into a suitable host for use as an insecticide. Expression of the toxin gene results, directly or indirectly in the intracellular production and maintenance of the pesticide. The microbe hosting the toxin gene can be treated under conditions that prolong the activity of the toxin produced in the cell and the treated cell can then be applied to the environment of target pest(s). The resulting product retains the toxicity of the B.t toxin. The present sequence encodes the amino acid sequence of the
                                                                                                                                                                                                                                                                                                                                                         28-APR-1988;

```

The invention relates to a hybrid pesticidal protein to cytotoxic agent and a pest gut epithelial cell recognit protein, where the cytotoxic agent and the recognition naturally contiguous. The hybrid toxin is expressed by from B.thuringiensis (B.t) var. kurstaki HD-73 which is

dal protein toxin cell recognition

a a

portion are not the gene fragme

                                                                                                     orientation. Also described is a vector for cloning a DNA molecule comprising: (a) a TAC promoter sequence; (b) a T7 primer sequence; (c) a transcription terminator sequence; (d) a sequence for an operon with an antibiotic resistance marker (ABR); (e) a repressor sequence coding for an inhibitor that is capable of regulating the operon of (d); and (f) a cloning site comprising at least one restriction enzyme site within the repressor sequence that does not change the amino acid sequence of the inhibitor, where the structural genes of the operon are replaced by at least one antibiotic resistance marker and are inhibitor, and where the repressor sequence is operatively linked to the TAC promoter sequence and the T7 primer is introduced for the purpose of sequenceing forms and the T7 primer is introduced for the purpose of sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a suitable host for use as an insecticide. Expression of the toxin gene results, directly or indirectly in the intracellular production and maintenance of the pesticide. The microbe hosting the toxin gene can be treated under conditions that prolong the activity of the toxin produced in the cell and the treated cell can then be applied to the environment of target pest(s). The resulting product retains the toxicity of the B.t toxin. The present sequence encodes the amino acid sequence of the junction between diphtheria toxin B chain His 484 and B.t HD-73 Cys 10,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified cloning vector with a system for direct selection of recombinants through activation of the antibiotic resistance for molecular DNA cloning for use in molecular biology.

                              nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying ballelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                        Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises the hybridising at least one or more nucleic acids to at least two or more nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                             perfect match, perfect mismatch, antisense match or antisense mismatch Also disclosed is a method of gene expression analysis. The array is use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

                                           part of the second retroviral component encodes a protein that is harmful to the cell; a stable cell line that is capable of producing a retroviral vector particle and/or an NOI, where at least part of the second retroviral vector particle of the NOI is harmful to the cell line; a stable cell line that is capable of producing an HIV vector particle; a method of producing a stable cell line compositing infecting a cell with the retroviral vector or particle; and a method of producing a protein that is harmful to a cell by infecting the cell with the retroviral vector or particle. The retroviral vector is useful in medicine, for producing a protein that is harmful to a cell, and for the manufacture of a composition to deliver an NOI to a patient in need of same. This sequence represents a primer used to isolate DNA encoding HIV gag-pol to test for transfer of the genes to a cell using the retroviral vector of
                                                                                                                                                                                                                                                                                          The invention describes a retroviral vector comprising, and capable of expressing, a nucleotide of interest (NOI), which encodes an RNA or production that is harmful to a cell. Also described are: a retrovirus production system for producing the retroviral vector comprising a nucleic acid sequence encoding for the first retroviral vector and nucleic acid sequence encoding for at least one component of the second retroviral vector; a retroviral vector produced by the production system, a retroviral particle obtained or obtainable from the retroviral vector; a cell infected with the retroviral vector and where the NOI or at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New retroviral vector comprising, and capable of expressing, a nucleotide of interest (NOI), which encodes an RNA or protein that is harmful to a cell, useful for producing a protein that is harmful to the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene therapy; retroviral vector; gene expression; retrovirus production system; HIV vector particle; medicine; gag-pol; gene transfer; PCR; primer; ss.

                                                                                                                                      DNA constructs in which the HIV gag, tat and rev genes are expressed from a single promoter and which lack the reverse transcriptase, integrase and envelope proteins are useful to generate immunogens. For the assembly of one suitable construct, the ca. 2kb SacI-MscI DNA fragment from pGGS1 (encoding the gag-protease region of the HIV genome) was subcloned into M13mp18 to provide a template for mutagenesis. Three mutations to remove 2 x HindIII and 1 x PstI sites were simultaneously introduced. A clone containing all 3 mutations was used as a template for further mutagenesis to place a stop codon, a BamHI site, codons for Arg and Ser, a second stop codon and PstI site at the end of the protease gene. Then, the 26-mer AAQ70579 was used to repair a single base deletion and the 39-mer AAQ70580 deleted 19 bases in the 5'-untranslated leader sequence involved in packaging RNA into the virion. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                  DNA construct expresses retroviral GAG-deriv. and REV-like elemetns from same promoter - also the expressed proteins and antigenic particles, useful in vaccines, diagnostic reagnate game the constructions.

                                                                                                                                                                                                                                                                                                                                                                                                            lentiviral long terminal repeat (LTR), tRNA binding site, packaging signal, promoter linked to at least one gene of interest (I), and an origin of second strand DNA synthesis and a 3'-lentiviral LTR. It includes a nuclear transport element (NTE) that is not an RRE (Rev responsive element). The vectors are used in gene therapy to express a wide range of (I) products including, e.g. antibodies, immunogens, toxins, antisense sequences, hormones, and enzymes, for the treatment of e.g. anaemia, diabetes, viral, other infections, and cancer. It is also used in vaccines to generate an immune response or for treating autoimmune diseases by down regulating such a response. The vectors may also be used to produce the expression products of (I), particularly in insect cell cultures. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New lentiviral vector and related cells - useful in gene therapy, cacompetent virus.

The method involves the use of oligonuclectide probes hybridising to regions of the human UDF-glucuronosyltransferase (UGT) genes (e.g. UGT1, UGT1A7, UGT1A9, UGT1A10, UGT2A1, UGT2B10, UGT2B11, UGT2B15, UGT2B17, UGT8), and the DDOST gene. The method and probes are useful for the genetic determination of enzymes participating in glucuronic acid conjugation with catalysed UGT. The method is both rapid and accurate. ABK51801-ABK51812 represent regions of the human UGT

                                                                                                                                                                                                                                                   Jacobs K, r
                               The invention relates to human secreted proteins (AAY21588-597) encoded by polynucleotides obtained from adult retina, adult brain, adult blood or adult testes CDNA libraries. The nucleic acid sequences encoding the secreted proteins correspond to clones AV421-2, BV278-2, C544-1, CC332-33, CC365-40, CG68-4, D329-1, H698-2 and H963-20, (all clones are deposited as ATCC 98145). The PNs and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation
           activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopolesis regulating activity, tissue growth activity, activin/
